

# Developing a common global framework for marine data management

***Helen Glaves***

***British Geological Survey***

# Drivers for modern ocean research

- Resource exploitation
- Marine planning
- Global environmental challenges
  - Climate change
  - Sea-level
  - Ocean chemistry (acidification)

# Drivers for sharing of marine data: policy

## European

- Marine Strategy Framework  
  - European Marine Observation and Data Network
- Marine Knowledge Strategy
- Blue Growth Strategy
- Galway Statement on Ocean Research  
  - Transatlantic Ocean Research Partnership

*“Australia’s ongoing marine research success depends on improved management of national and global marine research data and information”*

## Australia

- Marine Nation 2025
- National Marine Science Plan 2015-2025

# Drivers for sharing of marine data: scientific and economic

- Improved understanding of marine ecosystems
- Assessment of health of marine environments
- Modelling and forecasting of potential future changes
- Sustainable exploitation of the oceans
  - Maximisation of ecosystem services
  - Minimisation of human impact

THE GREAT BARRIER REEF  
GENERATES  
€505 billion/year  
AND  
69,000 JOBS

# Modern ocean observing

- Conducted by many organisations
- Wide range of equipment/sensors
- Various platforms
- Challenging environments
- Producing vast amounts of heterogeneous data

# Use and re-use of marine data: the challenges

- Inconsistent data formats
- Spatial referencing
  - Coordinate systems
  - Horizontal datums
- Different standards/best practice
- Data access policies (organisational, national and regional level)

# Data access policies

- Vary between organisations, countries and regions
- Publicly-funded data
  - Open-access
  - INSPIRE
  - Lack of globally-consistent policies
- Commercial data
  - Collected for specific purposes
  - No open access mandate
- Maritime security

# Marine e-infrastructures

- Regional e-infrastructures
  - Address specific ‘local’ requirements for data discovery and access
  - Developed in response to needs of the user community and funding agency policy and guidelines
  - Created in isolation to those in other regions
- Global e-infrastructures
  - Domain specific e.g. IODE – ODP
  - Multidisciplinary e.g. GEOSS

# Global framework for marine data management

- Supports sharing of marine data across regional and global systems
- Single point for user access
- Delivering interoperable data
- Implementation requires:
  - Significant resources
  - Cultural change
  - Based on existing marine data systems

# Ocean Data Interoperability Platform (ODIP/ODIP II)

EU-USA-Australia collaborative project

ODIP: October 2012 – September 2015

Funded in parallel by:

- European Commission
- National Science Foundation (NSF)
- Australian Government

ODIP II: April 2015 – March 2018

Australian Government

## ODIP/ODIP II: Objectives

- Develop a common global approach to marine data management
- Establish a European - USA – Australia -Canada co-ordination platform to promote dialogue between regional marine data infrastructures
- Demonstrate this coordinated approach by:
  - developing common approaches for specific aspects of marine data management e.g. vocabularies, data formats
  - establishing interoperability between existing regional marine data infrastructures and with global systems

## ODIP/ODIP II: Objectives

- Develop a common global framework for marine data management
- Establish a European - USA – Australia -Canada co-ordination platform to promote dialogue between regional marine data infrastructures
- Demonstrate this coordinated approach by:
  - developing common approaches for specific aspects of marine data management e.g. vocabularies, data formats
  - creating an inventory of standards, best practices etc.
  - establishing interoperability between existing regional marine data infrastructures and with global systems

*International data infrastructures*

**AUSTRALIA**

**USA**

***Regional data infrastructures***

# ODIP 1: Discovery and access of marine data

Establishing interoperability between regional marine data discovery and access services :

- SeaDataNet, (Europe)
- AODN (Australia)
- US NODC/NCEI (USA)

- Using EuroGEOSS GEO-DAB brokering services
- Facilitate sharing of metadata
  - across regional data infrastructures
  - with global GEOSS portal and IODE ODP

# ODIP 1: Further development

- Move to fully operational system
- Dynamic propagation of updates throughout the component data infrastructures
- Improve semantic interoperability
- Enhanced horizontal interoperability between regional data systems

## ODIP 2: Cruise summary reports (CSR)

- Establishing interoperability:
  - regional cruise summary reporting (CSR) systems
  - global cruise catalogue (POGO)
- Unified system for cruise discovery
  - Common formats, standards and vocabularies
  - Routine harvesting of cruise data from regional systems using GeoNetworks

## ODIP 2: progress

- SeaDataNet CSR (Cruise Summary Report) 3.0 schema (ISO 19139 compliant) adopted by:
  - R2R consortium partners (USA)
  - Marine National Facility (Australia)
- GeoNetwork catalog deployed providing GUI interface and API (CSW service).
- ISO Cruise Summary Reports harvested from regional nodes and exposed in the POGO portal
- Large number of new CSRs added to POGO CSR Catalogue service including >1700 CSRs for the USA

**Details of Kilo Moana Cruise C-MORE 2014 Leg 5 (BSH Ref-No.: 20156133)**

**GENERAL INFORMATION**

- Platform/Ship
- Cruise begin
- Cruise end
- Port of Departure
- Port of Return
- Chief Scientist(s)
- Responsible Laboratory

**LOCATION**

- General Ocean Areas
- Marsden Squares(S, N, E, W)
- Bounding Box(es)

**PROJECT**

Project Title / Coordinating Body

**OBJECTIVES**

Description Expanding Mariana Trench Perspectives

**ADDITIONAL INFORMATION**

Parameters measured  
Instruments used current profilers  
fluorometers

## ODIP 2: Further development

- Further ingestion of CSRs and population of POGO portal
- Upgrading of CSR schema to accommodate requirements for Linked Data
  - Publishing CSRs in RDF
  - Provide SPARQL endpoints for CSR services

## ODIP 3: Sensor web enablement

- (Near) real-time access to ocean sensor data
- OGC suite of standards and best practice
  - Domain independent
  - High degree of flexibility
  - Potential for divergence
- Common marine SWE profile
- Delivers ocean observing system data directly to data centres
- Supports integration with data discovery systems

## ODIP 3: progress

- Multiple initiatives in the marine domain addressing some aspect of SWE:
  - Europe research projects for observing systems (EuroFleets, JERICO FixO3, AtlantOS, GROOM), data management (SeaDataNet ); instruments and sensors (Sense OCEAN, NEXOS, and SChEMA),
- USA major implementations of SWE in US-IOOS programme
- Initiatives including SWE in Australia
- Community of practice
  - Testbed
  - Collaboration tool e.g. GitHUB

## ODIP 3: Further development

- Evaluate OGC SWE standards
- Provide recommendations for practical implementation of the standards
- Develop marine profiles of relevant OGC SWE standards
- Support greater interoperability across existing SWE systems

# ODIP II: Cross-cutting themes

- Data citation and publication
- Persistent identifiers: DOIs, ORCIDs etc.
- Vocabularies: RDF, SPARQL endpoints, mappings etc.
- Big data and model workflows

## Final remarks

- Ecosystem level marine research has made an integrated global network of data services a necessity
- Leveraging existing marine data infrastructures to establish a common global framework for marine data management potentially overcomes many of the recognised barriers to the sharing of marine data.

## Final remarks

- An approach based on existing marine data systems is one that is potentially highly scalable and robust, as well as being transferable to other domains
- Establishing interoperability across regional data infrastructures and with the larger global data systems makes marine data more widely available for a diverse range of multidisciplinary applications
