

A New World Ocean Temperature Profile Product (v0.1): The International Quality Controlled Ocean Database (IQuOD)

The IQuOD Project Team (including SCOR working group 148 and IOC/IODE SG-IQuOD), IQuOD.org, catia.domingues@utas.edu.au

Reliable long-term ocean subsurface temperature measurements are critical for understanding changes in the Earth's energy imbalance, ocean temperature, sea level, and also separating natural variability from anthropogenic factors.

The International Quality Controlled Ocean Database (IQuOD, www.iquod.org), with support from programmes, such as CLIVAR, SCOR and IODE, is the first internationally-coordinated community effort to enhance the content, utility, and quality of the global historical profile database of subsurface temperature observations, and with the potential to expand to other oceanographic variables (salinity, oxygen, etc.).

Progress to date includes inclusion of uncertainty estimates to temperature profiles on each depth (pressure) and intelligent metadata for unknown probe types (identified through a deterministic approach using country, year, depth, etc, Palmer et al., 2018) for a major instrument of the historical record. This initial progress has been recently released as part of an interim product, IQuOD v0.1, which is now part of the existing NOAA's World Ocean Database (WOD) with IQuOD quality flags. Users can publicly download this WOD/IQuODv0.1 through the WODselect system in a Climate-Forecast (CF) compliant netCDF ragged array format. This interim product will also be distributed to the public via other data centers in Australia, France, Germany, Japan and the UK.

Additional efforts are underway to establish an internationally-agreed optimal set of automatic quality control procedures (<https://github.com/IQuOD/AutoQC>) and to incorporate machine learning into expert quality control. These ongoing efforts will be published as part of future IQuOD interim product releases.

International Quality Controlled Ocean Database (IQuOD) version 0.1 - aggregated and community quality controlled ocean profile data 1772-2018 (NCEI Accession 0170893)

Preview graphic

This data set includes subsurface ocean profiles of temperature, salinity, oxygen, nutrients, ocean tracers, optics, and biology (chlorophyll, plankton) taken from 1772 to 2018 in the global ocean using bottles, CTD, XBT, MBT, profiling floats, moored buoys, ice drifting buoys, gliders, towed profilers, and instrumented pinnipeds. This data set was prepared at NCEI in CF compliant netCDF ragged array format under the direction of the IQuOD project. The IQuOD (International Quality-controlled Ocean Database) effort is being organized by the oceanographic community, and includes experts in data quality and management, climate modelers and the broader climate-related community. The primary focus of IQuOD is to produce and freely distribute the highest quality and complete single ocean profile repository along with (intelligent) metadata and assigned uncertainties for use in ocean climate research applications. This goal will be achieved by developing and implementing an internationally agreed framework. IQuOD v0.1 is a preliminary data set which includes uncertainties on each temperature measurement and intelligent metadata for identifying critical missing information.
